SCALEWAY CONSOLE

How to create a Scaleway account

[Follow our guide](#) to create your Scaleway account to deploy your first project with ease.

Watch your way through the first steps: [How to create a Scaleway account](#)

Magic Link Authentication

Instead of using your password, you can use a Magic Link to authenticate yourself against the management console. It provides quick and secure access to your account without the hassle of remembering your password. Learn how to enable it with [this tutorial!](#)

Getting Started with the Scaleway Console

The Scaleway Console allows you to view and manage your Scaleway Elements products, billing information, support tickets and more. Learn how to navigate the console for the first time with [this quickstart!](#)

The screenshot displays the Scaleway Console interface. On the left is a sidebar with navigation links: Project dashboard, Compute (Instances, Bare Metal, Kapsule, Serverless), Storage (Object Storage, Database), Network (Load Balancer, DNS), Tools (Container Registry, IoT Station, IoT Hub), and Support (Abuse, Documentation, Dedibox Console). The main content area is titled 'Organization : Lulu's Cool Orga' and includes a 'Create' button. Below this is a 'Resources Overview' section with a table listing: Instances (3), Kapsule clusters (1), Object Storage (1.2 GB), Namespaces (370 MB), and IoT Hubs (1). To the right is a 'Current Consumption' donut chart showing costs for Instances (€15.61), Storage, and Network (€4.01), with a note 'excl. taxes'. Below the chart are buttons for '2 active billing alerts', 'Last invoice', and 'Updated 2 hours ago'. At the bottom, there are sections for 'Changelog' (highlighting 'Easy Deploy') and 'News' (with dates from OCT 20, 2020).

Managing Multi-User with Scaleway Organizations

Organizations is Scaleway's Multi-User feature. An Organization is a resource system, with hierarchically organized accesses and permissions. Learn how to navigate the feature to centrally manage and share resources across multiple accounts by following [the documentation](#).

Manage your projects

Project is Scaleway's resource management feature. Designed to help you organize your infrastructure and cloud services, the feature allows resources to be isolated and grouped into specific projects, each with their own credentials. Follow [this guide](#) to group your features into a project.

How to create and enable SSH Keys

When connecting to an Instance, the authentication is based on secure SSH keys instead of passwords. SSH keys allow password-less authentication on secure shell (SSH) connections. [Follow our how-to](#) to find out how to configure and enable a SSH key on Windows, MacOS or Linux computers.

Watch your way through the first steps:

- [How SSh Keys Work](#) ^{1/3}
- [How to create or recreate an SSH key](#) ^{2/3}
- [How to create or recreate an SSH Key?](#) ^{3/3}

How to generate an API Key

API Keys are unique identifiers associated with your Scaleway account and consist of an Access Key and a Secret Key. Follow [this guide](#) to learn how to generate a Security Key and how you can use it to authenticate against our API.

Recover your lost Password

In case you have lost the password of your Scaleway console account, you can recover it using different methods. [Follow the how-to](#) to find out how!

Enable Billing Alerts

The Scaleway console Billing Alerts feature allows you to manage and keep track of your expenses by setting up alerts to trigger when a budget threshold is reached. An alert can be sent to you by SMS, e-mail or API webhook. In [this how-to](#), we teach you how to enable them.

TOOLS

APIs

Automate your workflows

[Scaleway Developer Tools Documentation](#)

Scaleway's APIs are a key part of the Scaleway Ecosystem: anything you can do from the web console can be done through APIs. APIs give you access to all Scaleway products, including storage, compute and much more. You can get information about your infrastructure, create instances, perform backups and much more with just a few HTTP(S) requests.

Command Line Interface (CLI)

Download and build the CLI

[Scaleway Command Line Interface](#)

The Scaleway Command Line Interface (CLI) helps you manage your Scaleway environment. It allows you to administer, execute and monitor your resources faster. Scaleway CLI is easy to use and offers many commands to interact with infrastructure such as login, creating servers, attaching volumes, moving IP addresses, fetching the logs and many others.

Terraform

Automate infrastructure resources

[Deploy Your First Infrastructure on Scaleway using Terraform](#)

HashiCorp Terraform is an open-source software tool to deploy IaC: Infrastructure as Code. It means that you can automate infrastructure resources such as Network, Instances, Elastic Metal servers and more. It allows you to use declarative configuration files to manage the full lifecycle — create new resources, manage existing ones, and delete those no longer needed.

PRODUCTS

COMPUTE

Instances

Kick off Your Project

[How to Create and Connect to Your First Compute Instance](#)

Follow these few simple steps and create a Scaleway instance and start developing your project today.

Watch your way through the first steps: [How to create an instance?](#)

Protect your instance

[How to Configure a Firewall on Your Server](#)

Learn how to configure a firewall. This step-by-step will teach you to simplify the control of incoming and outgoing network traffic based on predefined security rules with Uncomplicated Firewall (UFW).

Back up your data

The backup feature allows you to create an image of your Instance, which contains all its volumes. You can use this image not only to restore your Instance and its data, but also to create a series of Instances with a predefined configuration. Find out how in [this how-to](#).

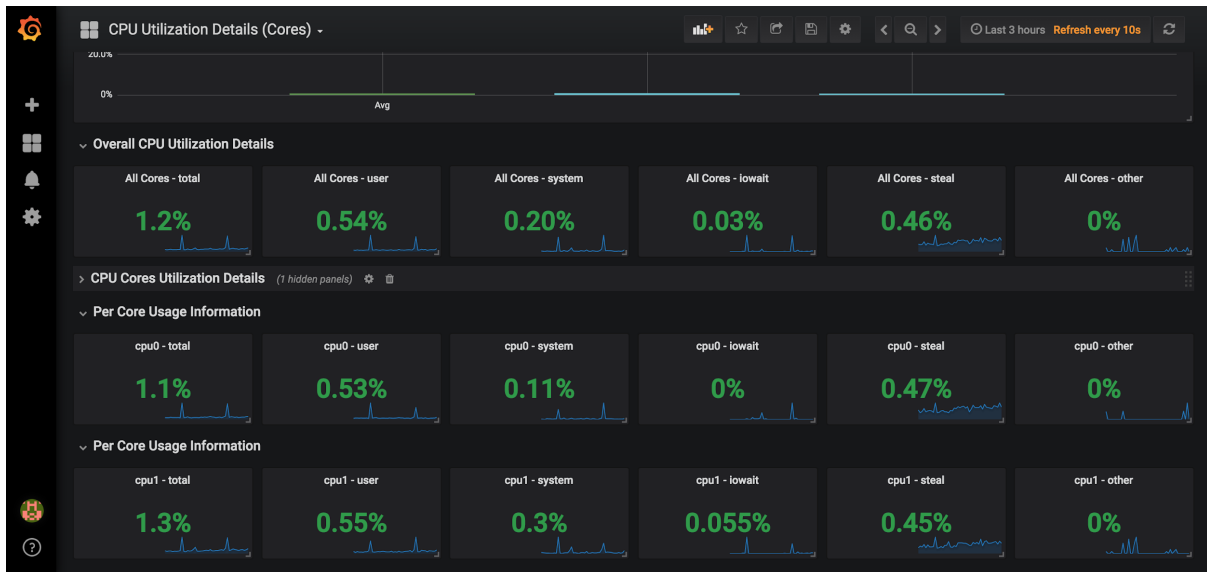

Use flexible IPs

Flexible IP addresses allow you to do live migration of IP addresses between your Instances. You can hold flexible IP addresses independently of any Instance, and attach and detach them to/from any of your Instances. You can keep a number of flexible IP addresses in your account at any given time. Learn [how to use IP addresses with Instances](#).

Monitor your instance

GPU Instances

Kickoff your Project

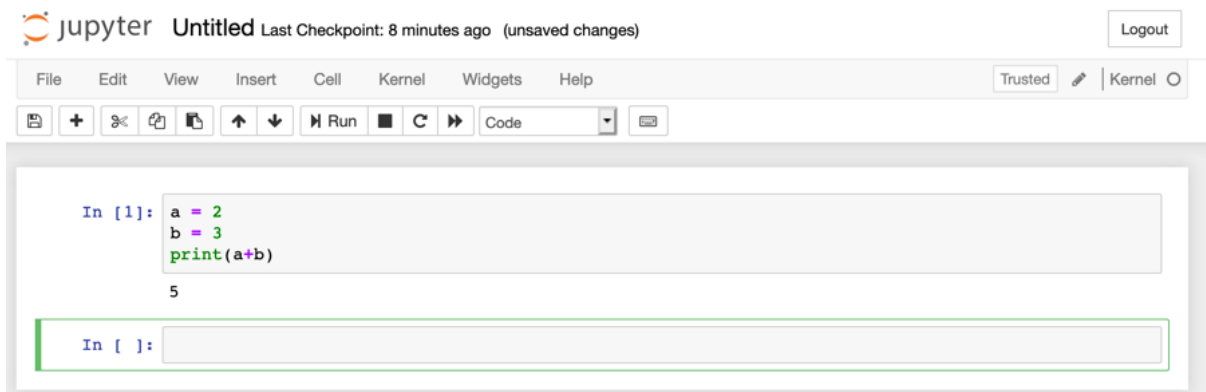

[How to Create your first GPU Instance](#)

GPU servers are designed for artificial intelligence, machine learning and complex modeling. They are equipped with high-end GPUs and huge quantities of cores, memory and storage. In short, GPUs are optimized for taking huge batches of data and performing the same operation over and over very quickly. Start developing your project with GPU today.

Visualize your code

[How to setup and configure Jupyter Notebook on a GPU instance](#)

Jupyter Notebook is a client-server application that allows users to edit and run Notebook documents in a web browser. The application combines code, comments, multimedia contents, and visualizations in a single interactive document — called a notebook — which runs in a web browser. Follow the tutorial to set it up.

Enhance image quality

[Achieving Super Resolution with a Sub-Pixel Convolutional Neural Network on Scaleway GPU](#)

Super resolution is the process of enhancing the details of a low-resolution image to recover a high-resolution image. In the context of deep learning, the technique consists of taking a low-resolution image as input, passing it through a neural network and receiving an output which will be a higher resolution version of the input. In this tutorial, we will show you how to prepare your data, construct the Sub-pixel convolutional neural network, train it and test it using a Scaleway GPU instance.

Elastic Metal

Kickoff Your Project

[Elastic Metal Servers Quickstart](#)

Scaleway Elastic Metal servers allow you to order dedicated servers on-demand, like cloud instances. Elastic Metal servers can be used for large workloads, big data and applications that require increased security and dedicated resources. Start developing your applications today!

Dive deeper with our Webinars:

Relying on Elastic Metal to manage your workloads: [Part 1](#) and [Part 2](#).

Configure additional IP addresses

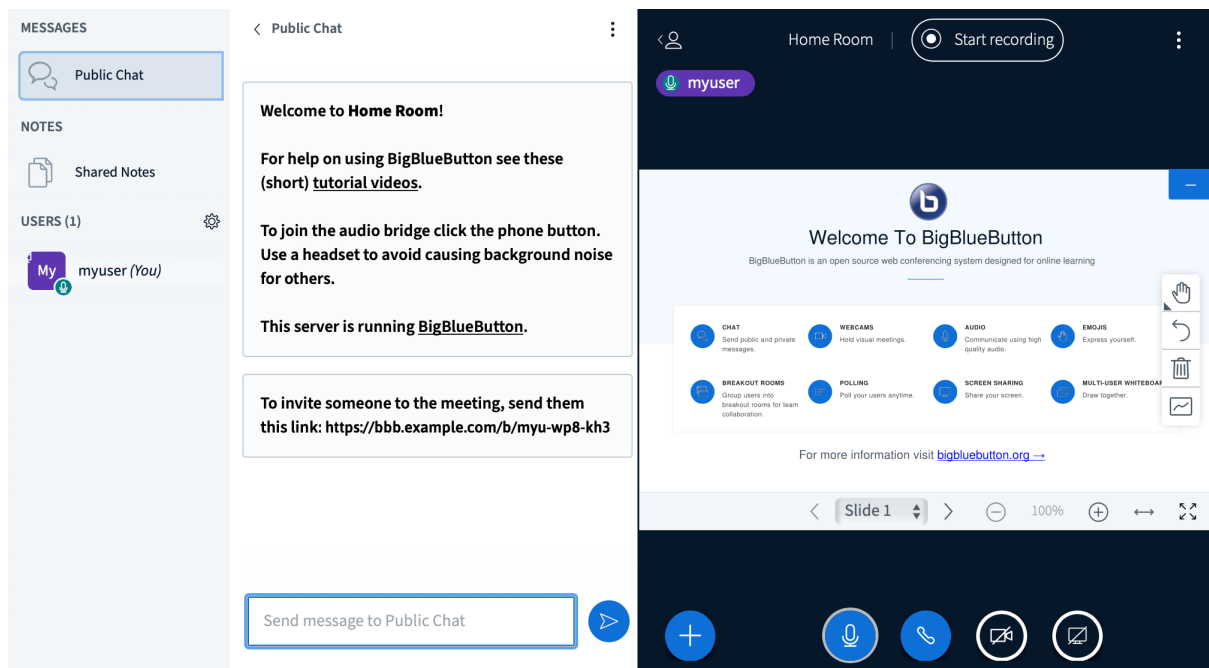

[How to order a Flexible IP](#)

Flexible IP addresses are additional IP addresses, available for Elastic Metal servers. They allow you to move an IP from one server to another without changing your whole configuration. Flexible IPs can also be used as additional IP addresses to create virtual machines on your Elastic Metal server.

Setup a Video Conferencing Solution

[Deploy BigBlueButton on your Elastic Metal server](#)

After having successfully deployed the application for the community during the initial stages of the COVID-19 crisis, we show you how to deploy a BigBlueButton platform on your servers.

and dozens of other metrics with Grafana and its custom dashboards.

Create Containerized Applications

[Creating Containerized Applications with the Easy Deploy Feature](#)

The Easy Deploy feature allows you to pull images directly from Scaleway Container Registry, instantly deploying containerized applications in your Kubernetes Kapsule cluster. With only the basic options to set, you can use Kubernetes Kapsule without managing your .yaml manifests. Find out how in this guide.

Container Registry

Store, manage and deploy container images

[Container Registry Quickstart](#)

Scaleway Elements Container Registry is a fully-managed mutualized container registry, designed to facilitate storing, managing and deploying container images. The service simplifies the development to production workflow as there is no need to operate an own container registry or to worry about the underlying infrastructure. Find out more with the [documentation](#).

Deploy images on Kapsule

[How to Deploy an Image from Scaleway Elements Container Registry to Kubernetes Kapsule](#)

A container image consists of several bundled files, which encapsulate an application. This image can be built on a local machine, uploaded to the image registry, and then deployed on several Kubernetes pods with Kapsule. Kapsule is the managed Kubernetes service provided by Scaleway Elements. In this tutorial you learn how to create and push a container image to the Scaleway Elements Container Registry and how to use it on Kubernetes Kapsule.

Serverless

Manage your production environment

[How to manage a Container](#)

A container is a package of software that includes all dependencies: code, runtime, configuration, and system libraries so that it can run on any host system. Scaleway provides you with custom Docker images that are entirely handled for you in the cloud. With Containers, you can rely on your favorite technologies such as Django or Ruby On Rails. Learn how to manage your containers with [this how-to](#).

Simplify development

[How to manage a Function](#)

With Serverless Functions, you can focus on writing and deploy your code easily. A function defines a procedure on how to change one element into another. The function remains static, while the variables that pass through it can vary. Find out how it works with the [documentation](#).

STORAGE

Object Storage

Learn how to store your objects

[Getting Started with Scaleway Object Storage](#)

Take the first steps with Object Storage: create your first bucket, learn how to upload and download objects, access objects via web browser, enable bucket versioning and change storage classes. We show you how in this beginner guide!

Set up bucket policies

A bucket policy is a resource-based policy option. It allows users to grant access to buckets in other Scaleway projects and organizations. By default, all Object Storage resources in a project are private and can be accessed only by users of said project. Adding a bucket policy to a bucket allows you to grant access to outside users. You can use different combinations of the policy's component strings to customize your permissions for different purposes as required. Learn more on our [documentation](#).

Protect your data

[Setting up a Nginx reverse proxy with Object Storage](#)

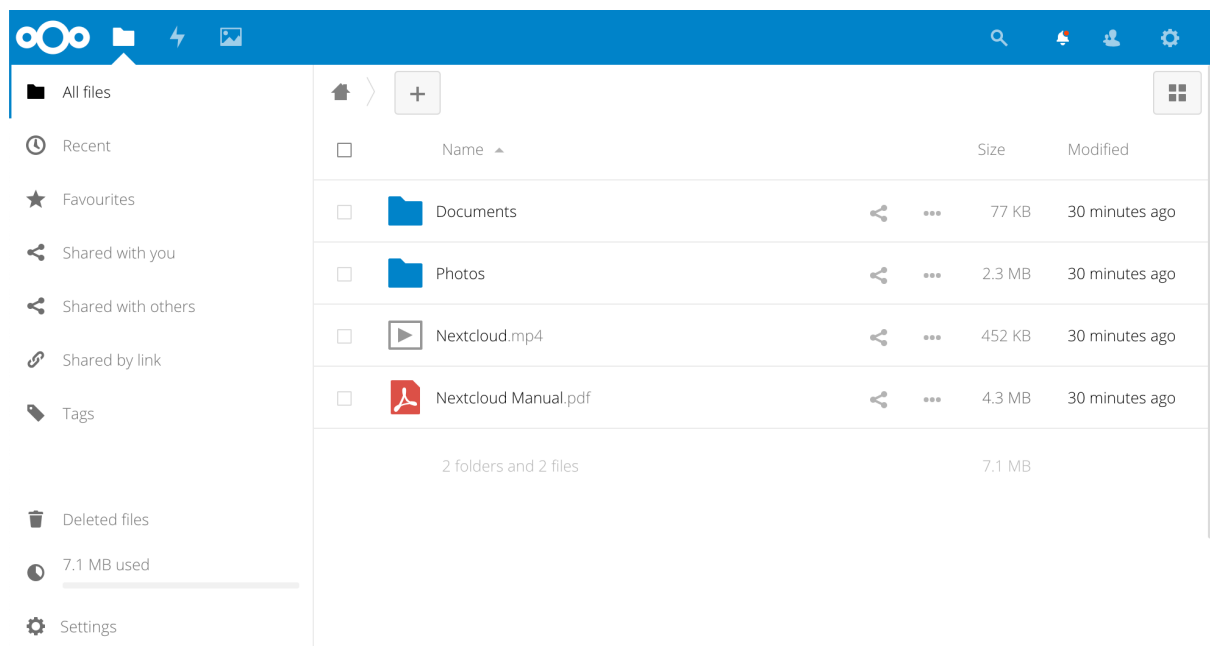

Learn how to set up a Nginx reverse proxy with Object Storage to provide **read-only** access to your buckets' contents.

Manage and share your files

[Deploy Nextcloud with Object Storage](#)

Nextcloud is an open source, self-hosted file share and communication platform. It allows you to manage and organize files by uploading and downloading them into a storage

space of your choice manageable via web browser or phone and desktop applications. Combine Nextcloud with Object Storage to benefit from infinite storage space!

Benefit from s3 features

Learn how to use the TimescaleDB, a time series database built on top of PostgreSQL, with a Scaleway managed Database.

NETWORK

VPC

Set up Private Networks

Private Networks enable you to build a virtual Layer 2 network between your Scaleway resources, such as Instances, Elastic Metal servers and Database Instances, allowing them to communicate in an isolated and secure network. Learn how to use them with [this how-to](#).

Create Public Gateways

Public Gateways sit at the border of Private Networks and provide extra functionality. They provide services to automate the allocation of private IP addresses (DHCP), and deal with traffic entering and exiting the network (NAT). You can add a Public Gateway to each of your Private Networks. Follow the [how-to](#).

Load Balancer

Distribute workload

[Scaleway Load Balancer Quickstart](#)

Load Balancers are highly available and fully-managed instances which allow you to distribute the workload among your various services. They ensure the scaling of all your applications while securing their continuous availability, even in the event of heavy traffic.

Increase trust level

[How to import your own SSL cert to a Load Balancer](#)

The managed Load Balancer service supports Let's Encrypt SSL/TLS certificates by default. It is possible to import your own SSL certificate in case you want either to use a self-signed

certificate or to increase the trust level issued by another certificate authority (CA). Follow this tutorial to find out how!
